

Preliminary Conclusion

The Alcohol Feature :

Alcohol characteristic change is obvious in countries with increased suicide rates, but are poorly performed in countries with reduced suicide rates (with both rise and fall)

The Health Expenditure Feature:

All the countries' health expenditure are rising regularly in the past decades. So this feature has no correlation with the suicide rate , suggesting to eliminate.

The Unemployment Feature:

The unemployment rate performs strongly in the showed graphics, in countries with increased suicide rates, the unemployment rate has increased significantly, while in the countries with decreased suicide rates, the unemployment changes much more slightly no matter rising or deceasing .
